

**Request:** Industry

**Date:** January 2011

**Purpose:** The data will be used internally only to populate patient forecasting models which are used for business planning. Business planning includes stock requirements forecasts, revenues forecasts and developing a general understanding of the market.

Table 1: CD4 category by treatment regimens (reproduction of ASR report table 7.1.1 – specifically CD4 re-categorisation of CD4) (a) 2008. (b) 2009.

(a) 2008

	Regimen										Total <sup>1</sup>	
	Rx NAIVE		MONO/DUAL		NNRTI+PI,+/-NRTI		3+ NRTI+/-PI, NO NNRTI		3+ NRTI+NNRTI, NO PI			
	N	%	N	%	N	%	N	%	N	%		
<200	8	4	22	10	21	10	89	41	76	35	216

- 
1. 491 unique ART regimens; and a total of 1,995 regimens recorded among 1,638 patients on combination ART.
  2. 492 unique ART regimens; and a total of 2,007 regimens recorded among 1,709 patients on combination ART.
  3. 473 unique ART regimens; and a total of 1,888 regimens recorded among 1,700 patients on combination ART.

NOTE: Some AHOD sites record fixed dose combination (fdc) drugs, such as Truvada, as their individual components (Emtricitabine and Tenofovir).

Table 4(a): Most frequent ARV combinations (3+ ARVs) in 2007 (A modified Table 7 from AHOD Annual report). 334 unique ART regimens; and a total of 1,995 regimens recorded among 1,638 patients on combination ART.

NOTES:

- (1) Some AHOD sites record fixed dose combination (fdc) drugs, such as Truvada, as their individual components (Emtricitabine and Tenofovir).
- (2) Some ARVs are masked with an X in order to reduce the total number of regimens and focus on the core components observed in AHOD.
- (3) Combinations with an X component are further described by whether the X's are from the NRTI class of drugs or Other (NNRTI, Fusion and Entry Inhibitors, Trial drug) or both NRTI and Other.
- (4) Combinations marked with a P indicate a Protease Inhibitor is used in the combination.
- (5) NRTI sparing is defined as a regimen without a NRTI component class drug.
