ACKNOWLEDGEMENTS

We would like to acknowledge the many people who assist in the development and conduct of the Australian NSP Survey, particularly the clients, staff and managers at participating NSP services. We also appreciate the dedication and vision of the founding members of the project and the late Dr Margaret MacDonald who was responsible for the development and conduct of the ANSPS until 2003.

Special thanks go to Mr Philip Cunningham, Senior Scientist and Operations Manager and Ms Beth Catlett, DBS Coordinator from the NSW State Reference Laboratory for HIV at St Vincent's Hospital and St Vincent's Centre for Applied Medical Research (AMR). Thanks are also due to Ms Rachel McCleave and Ms Sue Linsen from the Kirby Institute and to Mr Greg Smith and Ashwin Prekesh from Educational Assessment Australia, UNSW Global Pty Limited.

In 2016, the project received support and input from the following members of the Australian NSP Survey National Advisory Group: Ms Tammy Waters and Helene Delany (ACT); Ms Rose Mason (NSW); Mr Shayne Kilford and Katherine Moriarty (NT); Mr Stephen Lymb and Mr Rob Gerrie (SA); Ms Francine Smith (TAS); Ms Cath Williams (VIC); Ms Jude Bevan (WA); Mr Craig Cooper and Ms Angella Duvnjak (Australian Injecting and Illicit Drug Users League); Mr John Ryan (Pennington Institute); and Ms Sonja Memedovic, Dr Jenny Iversen, Professor John Kaldor and Professor Lisa Maher (Kirby Institute). We would particularly like to thank Mr Robert Kemp (QLD) for chairing the National Advisory Group.

Ethical approvals were obtained from Institutional Ethics Committees associated with the investigators and participating NSP sites. The Australian Needle and Syringe Program Survey is funded by the Australian Government Department of Health and Ageing. The Kirby Institute is affiliated with the Faculty of Medicine, UNSW Sydney.

ABBREVIATIONS

ANSPS	Australian Needle and Syringe Program Survey
HCV	Hepatitis C virus
HIV	Human immunodeficiency virus

KEY POINTS

- The Australian NSP Survey (ANSPS) functions as a strategic early-warning system designed to monitor blood borne viral infections and associated risk behaviour among people who inject drugs.
- In 2016, 50 Australian Needle and Syringe Programs (NSPs) participated in the ANSPS and 2,210 NSP attendees completed the survey. The response rate was 41%.

Demographic characteristics:

- Over the period 2012 to 2016, the median age of survey respondents increased from 38 years to 42 years, with a concurrent decrease in the proportion of young injectors (aged <25 years) from 7% in 2012 to 4% in 2016 (χ^2 trend p<0.001).
- The median time since first injection increased from 17 years in 2012 to 21 years in 2016, and the proportion of new initiates (those injecting for less than three years) declined significantly from 7% in 2012 to 5% in 2016 (χ^2 trend p=0.002).
- The proportion of respondents from an Indigenous Australian background increased significantly, from 12% to 18% over the period 2012 to 2016 (χ^2 trend p<0.001).

Injecting behaviour:

- Daily or more frequent injecting in the month prior to the survey was reported by approximately half of respondents in all survey years 2012 to 2016.
- The proportion of respondents reporting methamphetamine as the last drug injected increased from 26% in 2012 to 43% in 2016 (χ^2 trend p<0.001). Since 2014 methamphetamine has been the most commonly reported drug last injected nationally.
- There was a significant decrease in the proportion of respondents reporting heroin as the last drug injected, from 33% in 2012 to 28% in 2016 (χ^2 trend p=0.020).
- Pharmaceutical opioids were the third most commonly reported class of drugs last injected in all years 2012 to 2016, but prevalence declined from 14% to 8% (χ^2 trend p<0.001) over this period.
- Performance and image enhancing drugs (PIEDs) were reported as the last drug injected by between 4% and 7% of respondents over the period 2012 to 2016.
- Among new initiates to injection (those injecting for less than 3 years) in 2016, one in four reported last injecting PIEDs. Since 2015, methamphetamine has been the most commonly reported last drug injected among new initiates to injection.
- The proportion of respondents reporting reuse of needles and syringes (including reuse of one's own syringes) increased significantly, from 21% in 2012 to 27% in 2016 (χ^2 trend p<0.001). Additionally, there was a significant increase in the proportion of respondents reporting receptive sharing of needles and syringes, from 16% in 2012 to 19% in 2016 (χ^2 trend p=0.018).
- The prevalence of receptive sharing of drug preparation equipment remained stable, ranging from 28% to 32% over the five-year period (χ^2 trend p=0.088).

HIV and HCV antibody prevalence:

- HIV antibody prevalence remained low and stable nationally, ranging from 1.2% to 2.1% over the period 2012 to 2016 (χ^2 trend p=0.943).
- In all years 2012 to 2016, HIV antibody prevalence was higher among homosexual men compared to bisexual or heterosexual men, and compared to women.
- In 2016, HIV antibody prevalence was higher among Aboriginal and Torres Strait Islander respondents compared to non-Indigenous respondents (2.8% vs 1.0% respectively, p=0.004). Further, prevalence of HIV infection among Aboriginal and Torres Strait Islander respondents increased from 0.4% in 2012 to 2.8% in 2016 (p-trend= 0.015).
- Hepatitis C virus (HCV) antibody prevalence was stable over the period 2012 to 2016, ranging from 51% to 57% (χ^2 trend p=0.944).
- Across all survey years 2012 to 2016, prevalence of HCV antibody was higher among older respondents and those with longer injection histories.

HCV treatment uptake:

- The proportion of respondents who reported a lifetime history of HCV antiviral treatment was stable between 2012 and 2015 (range 10-13%, χ^2 trend p=0.251) but increased significantly to 29% in 2016 (five year χ^2 trend p<0.001).
- Similarly, the proportion of respondents who reported recent (last 12 months) HCV treatment was low and stable between 2011 and 2015 (range 1-3%, χ^2 trend p=0.455) but increased significantly to 22% in 2016 (five year χ^2 trend p<0.001).
- An increase in the proportion of respondents who reported recent initiation of HCV treatment was observed in all jurisdictions in 2016.

INTRODUCTION

The Australian Needle and Syringe Program Survey (ANSPS) provides serial point prevalence estimates of human immunodeficiency virus (HIV) and hepatitis C virus (HCV) antibody prevalence and sexual and injecting risk behaviour among people who inject drugs (PWID) in Australia. Conducted annually over a one-two week period in October, all clients attending participating Needle and Syringe Program (NSP) services are invited to complete a brief, anonymous questionnaire and to provide a capillary blood sample for HIV and HCV antibody testing (see methodological notes [Appendix B] for further details on the ANSPS design and implementation). This report presents national and state/territory findings for the period 2012 to 2016.

In 2016, 50 NSP services participated in the ANSPS. Over the period 2012 to 2016, the number of ANSPS respondents ranged from 2,210 to 2,407 and the annual response rate ranged from 41% to 48% (Table 1.1.1). Of the 2,210 ANSPS respondents in 2016, the majority (87%) were recruited from the 40 NSP services that participated in the ANSPS in all years 2012 to 2016. A list of participating NSP services is provided at Appendix A.

Demographic Characteristics

Approximately two thirds of survey respondents were male and less than one percent identified as transgender across all survey years 2012 to 2016. In 2016, the majority of respondents identified as heterosexual, while 10% identified as bisexual and 4% as homosexual (Table 1.1.1).

The proportion of respondents from an Indigenous Australian background increased significantly, from 12% to 18% over the period 2012 to 2016 (χ^2 trend $p<0.001$). In all survey years, the majority of respondents were born in Australia (ranging between 85% and 87%), with the United Kingdom and Ireland (4%) and New Zealand (3%) the predominant countries of birth outside Australia in 2016. Most respondents also reported that their parents spoke English at home (range 92% to 94% over the period 2012 to 2016).

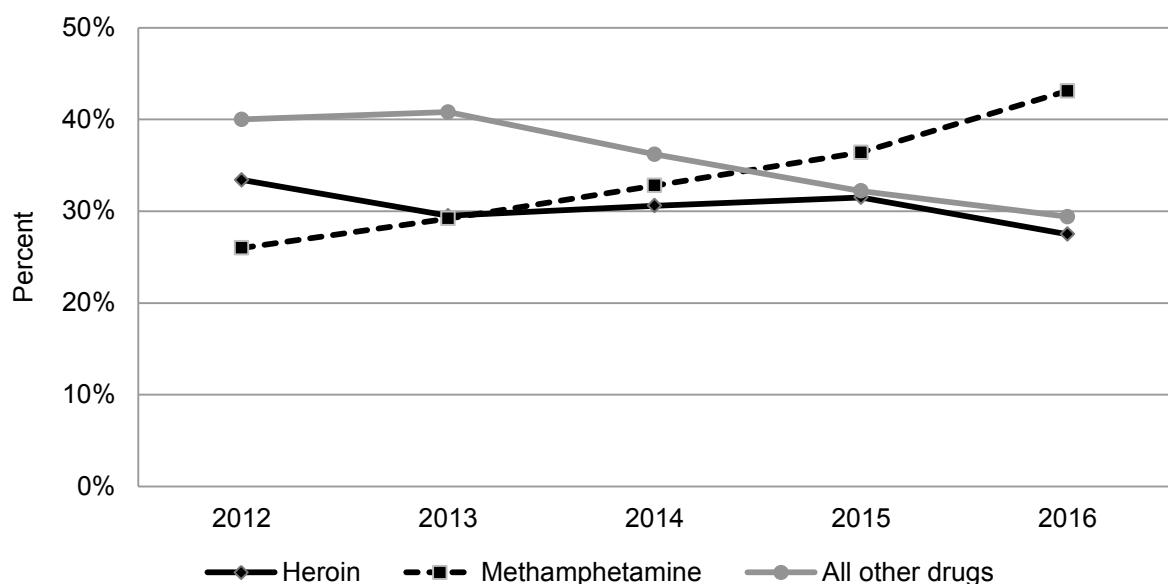

The median age at survey completion increased from 38 years in 2012 to 42 years in 2016 and there was a concurrent significant decrease in the proportion of young injectors (aged <25 years) from 7% in 2012 to 4% in 2016 (χ^2 trend $p<0.001$). The median time since first injection increased from 17 years in 2012 to 21 years in 2016, and concurrently, the proportion of new initiates (those injecting for less than 3 years) declined from 7% in 2012 to 5% in 2016 (χ^2 trend $p=0.002$). However, the median age at first drug injection was consistent across the period 2012 to 2016, ranging from 18 to 19 years of age (Table 1.1.1).

The proportion of respondents reporting incarceration in the 12 months prior to survey completion was stable at between 10% to 12% over the five-year period 2012 to 2016 (χ^2 trend $p=0.390$). Approximately one in three respondents with a history of recent incarceration reported injecting while in prison (Table 1.1.1).

Injecting behaviour

Methamphetamine has been the most commonly reported drug last injected nationally since 2014 (Table 1.1.2). Reports of methamphetamine injection increased significantly over the five-year period, from 26% in 2012 to 43% in 2016 (χ^2 trend $p<0.001$, Figure 1). In 2016, methamphetamine was the most commonly injected drug in the majority of jurisdictions, including New South Wales (36%), Northern Territory (43%), Queensland (39%), South Australia (60%), Tasmania (37%) and Western Australia (60%). Heroin was the second most commonly reported drug last injected nationally in 2016, with a significant decline in the proportion of respondents who reported last injecting heroin observed between 2012 (33%) and 2016 (28%, χ^2 trend $p=0.020$). Notwithstanding, heroin remained the most commonly reported drug last injected in the Australian Capital Territory (40%) and Victoria (52%).

Figure 1. Proportion of respondents (%) reporting last injecting heroin, methamphetamine and all other drugs, 2012–2016

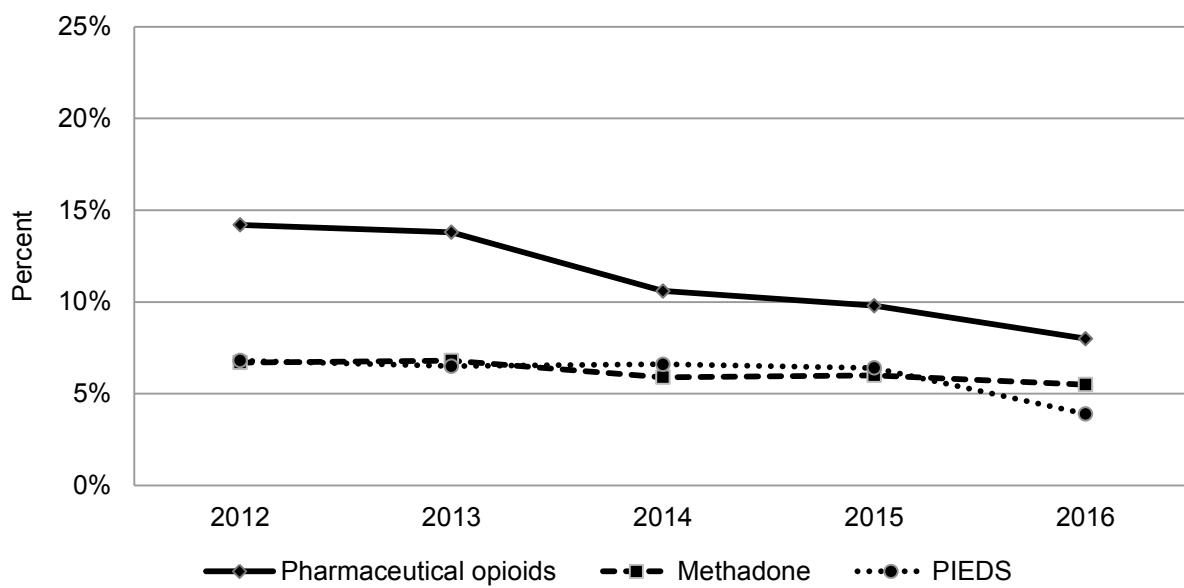

The third most commonly reported class of drugs last injected nationally was pharmaceutical opioids (including morphine and oxycodone), although prevalence declined from 14% to 8% over the period 2012 to 2016 (χ^2 trend $p<0.001$, Figure 2). In 2016, pharmaceutical opioids were the second most commonly injected class of drugs last injected in the Northern Territory (34%) and the third most commonly reported class of drugs last injected in Tasmania (20%).

Methadone was reported as the last drug injected by less than ten percent of the ANSPS sample in all years 2012 to 2016 (range 5% to 7%) and prevalence remained stable over this period (χ^2 trend $p=0.067$). Buprenorphine and buprenorphine-naloxone injection were reported by a minority of survey respondents. While the prevalence of buprenorphine-naloxone injection remained stable at between 1% and 2% (χ^2 trend $p=0.159$) over the period 2012 to 2016, the prevalence of buprenorphine injection declined from 4% to 2% (χ^2 trend $p=0.010$).

A minority of survey respondents (1% across all survey years) reported cocaine as the last drug injected. The prevalence of performance and image enhancing drugs (PIEDs) as the last drug injected declined significantly over the period 2012 to 2016 (χ^2 trend $p=0.001$, Figure 2). PIEDS injection in QLD ranged from 6% to 14% over the five-year period, although this variation was not statistically significant ($p=0.108$). Prevalence of PIEDs injection in NSW remained stable at between 10% and 12% (χ^2 trend $p=0.587$) and was $\leq 3\%$ in all other jurisdictions. From 2012 to 2014, PIEDS were the most commonly reported last drug injected among new initiates (less than 3 years since first injection) nationally, but since 2015, methamphetamine has been the most commonly reported last drug injected among this group. In 2016, one in four new initiates reported last injecting PIEDs.

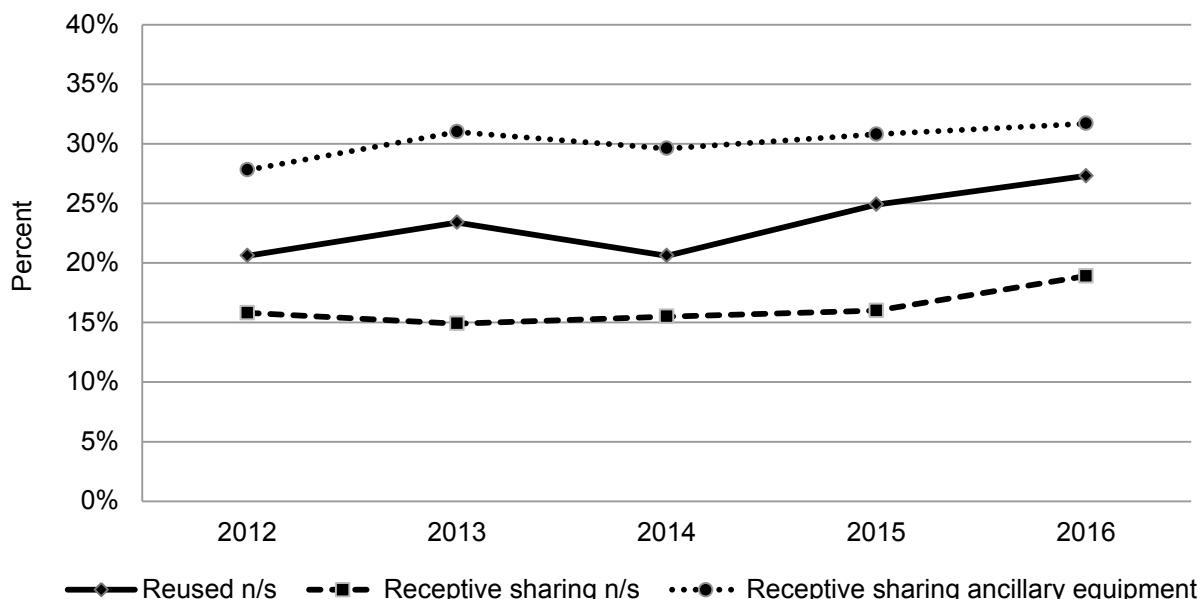

Figure 2. Proportion of respondents (%) reporting last injecting pharmaceutical opioids, methadone and performance and image enhancing drugs, 2012–2016

Daily or more frequent injection was reported by approximately half of respondents in all of the past five years (Table 1.1.2). Prevalence of at least one public injection (injection in a car, beach, park, street or squat) in the month prior to survey completion increased from 39% in 2012 to 46% in 2016 (χ^2 trend $p=0.035$, Table 1.1.3).

There were significant increases in two of the three key injecting risk behaviours over the five-year period (Figure 3). The proportion of respondents reporting reuse of needles and syringes (including one's own) in the month preceding the survey increased significantly, from 21% in 2012 to 27% in 2016 (χ^2 trend $p<0.001$). There was also a significant increase in the prevalence of receptive sharing of needles and syringes in the month prior to survey completion, from 16% in 2012 to 19% in 2016 (χ^2 trend $p=0.018$). Receptive sharing of ancillary equipment was stable over the period 2012 to 2016 (range 28% to 32%, χ^2 trend $p=0.088$). As in previous years, spoons and water were the most commonly identified receptively shared ancillary items in 2016 (Table 1.1.3).

Figure 3. Proportion of respondents (%) reporting reuse and receptive sharing of needles and syringes and receptive sharing of ancillary equipment in the last month, 2012–2016

Sexual behaviour

Approximately half of respondents reported sex with a regular sex partner in the month prior to survey completion, in all years 2012 to 2016 (range 47% to 48%, Table 1.1.6). Of these, the majority (70% to 77%) reported that they did not use condoms with their regular sex partner. A smaller proportion of respondents (14% to 15%) reported sex with other sex partners in the month preceding survey participation. Condom use was higher among this group, with approximately two thirds reporting use of condoms. The proportion of respondents reporting sex work in the month prior to the survey remained low and stable at 4% to 6% over the last five years (χ^2 trend p=0.474) and use of condoms at last paid sex was relatively high at between 62% and 82% in all years between 2012 and 2016 (Table 1.1.6). Of the respondents who reported sex work in the previous month in 2016 (n=121), 54% were women, 41% were men and 4% identified as transgender.

Drug treatment

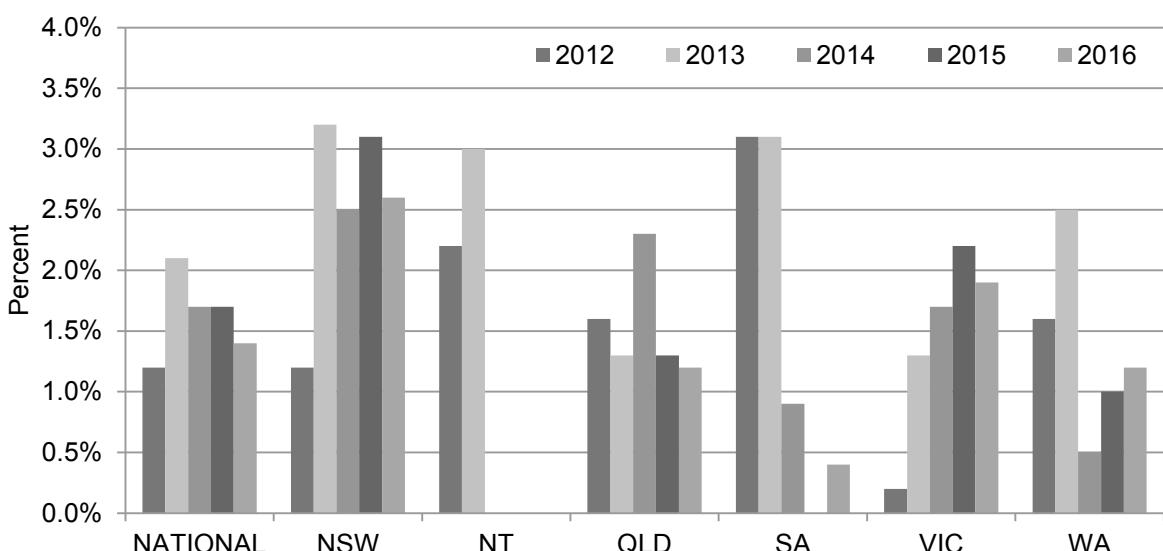

Engagement with drug treatment services was high (Table 1.1.4), with nearly three quarters (71%) of 2016 respondents reporting current or previous drug treatment. However, there was a significant decline in the overall proportion of respondents reporting current opioid substitution therapy (OST; methadone, buprenorphine or buprenorphine-naloxone treatment) from 43% in 2012 to 33% in 2016 (χ^2 trend p<0.001). Notwithstanding this overall decline, current OST among respondents who reported last injecting opioids was stable over the period 2012 to 2016 (range 48% to 52%, χ^2 trend p=0.470). In 2016, current methadone maintenance treatment was reported by 24% of respondents, with current buprenorphine treatment reported by 6% of respondents and buprenorphine-naloxone treatment by 7% of respondents.

HIV antibody prevalence

HIV antibody prevalence remained low and stable nationally over the period 2012 to 2016 (range 1.2% to 2.1%, χ^2 trend $p=0.943$, Table 1.2.1). At the jurisdictional level (Figure 4), there was a significant increase in the overall proportion of HIV antibody positive respondents in Victoria (range 0.2% to 2.2%, χ^2 trend $p=0.023$), with a significant increase in HIV antibody prevalence observed among Victorian men (Table 8.2.1). Conversely, in South Australia, there was a significant decrease in the overall proportion of HIV antibody positive respondents (range 3.1% to 0.0%, χ^2 trend $p=0.001$), with a significant decline in HIV antibody prevalence observed among women (χ^2 trend $p=0.002$, Table 6.2.1).

No respondents in Tasmania or the Australian Capital Territory tested positive to HIV antibodies in any of the previous five years, 2012 to 2016.

Figure 4. HIV antibody prevalence (%) by jurisdiction, 2012–2016

Nationally, across all survey years, HIV antibody prevalence was consistently higher among homosexual male respondents than among bisexual and heterosexual male respondents or female respondents (Table 1.2.2 and Figure 5). In the last four years (2014 to 2016), HIV prevalence was also higher among men who reported methamphetamine as the last drug injected compared to men who reported last injecting other drugs (Table 1.2.4) and among men who reported sex work in the month preceding the survey compared to men who did not report sex work (Table 1.2.10).

In 2016, respondents from an Aboriginal and/or Torres Strait Islander background were significantly more likely to test HIV antibody positive than non-Indigenous respondents (2.8% vs 1.0% respectively, $p=0.004$). Further, prevalence of HIV infection among Aboriginal and Torres Strait Islander respondents increased from 0.4% in 2012 to 2.8% in 2016 (p -trend= 0.015). Of the n=10 Indigenous respondents who tested HIV antibody positive in 2016 and who reported their sexual identity (n=1 not reported), one in two (n=5, 50%) identified as heterosexual.

Figure 5. HIV antibody prevalence (%) by gender and sexual identity, 2012–2016

In 2016, the median age of HIV antibody positive respondents was 47 years (range 22-66 years) and respondents first injected a median of 17 years prior to survey participation (range 3-40 years). In 2016, there was no difference in the median age ($p=0.123$) or the median time since first injection ($p=0.124$) among HIV positive and negative respondents.

HCV antibody prevalence

HCV antibody prevalence remained stable both nationally (range 51% to 57%, χ^2 trend $p=0.944$, Table 1.3.1) and in all jurisdictions over the period 2012 to 2016 (Figure 6). Across all five years of the survey, HCV antibody prevalence was significantly higher among older respondents and those with longer injection histories (Table 1.3.3 and 1.3.5). Figure 7 illustrates the correlation between exposure to HCV and time since first injection among respondents in 2016.

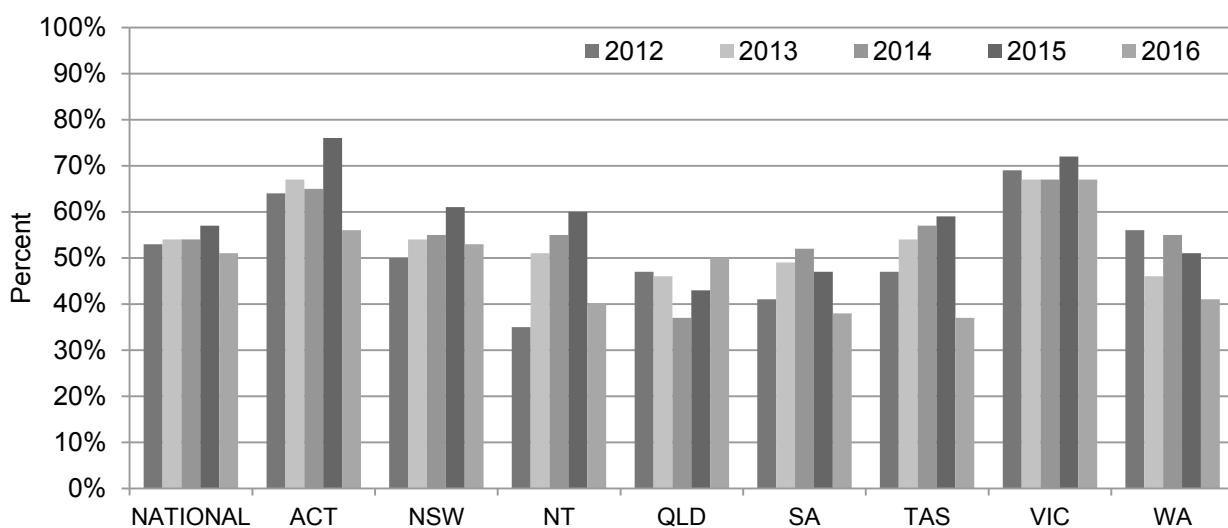

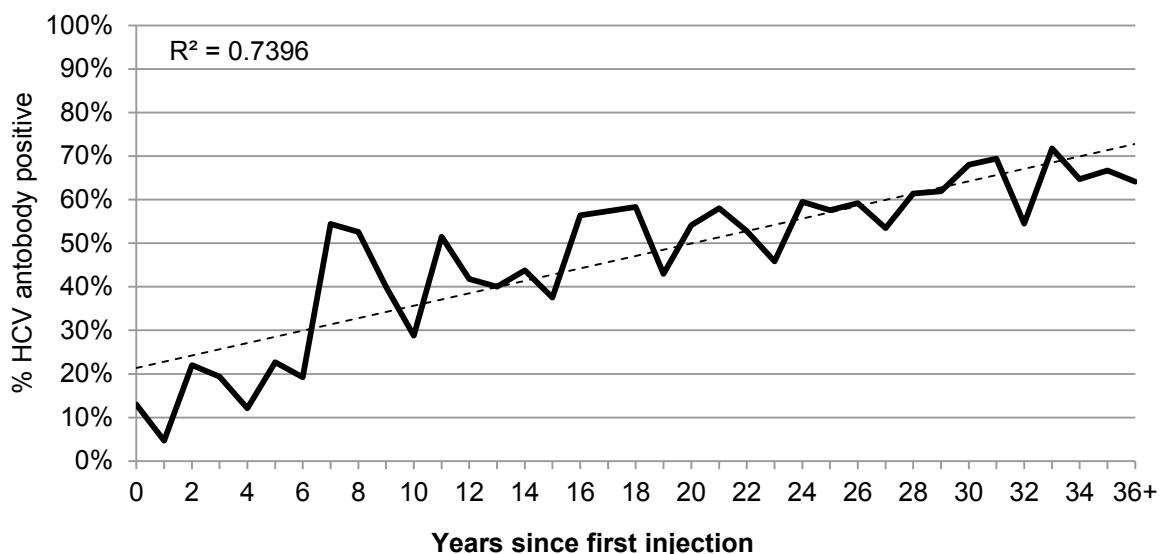

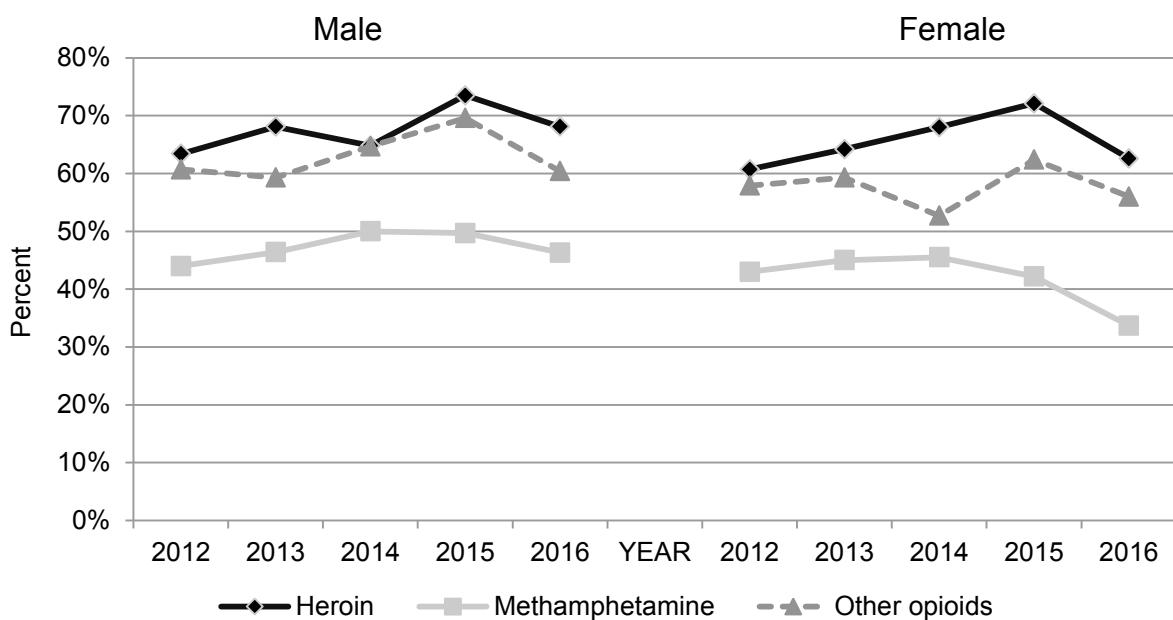

Figure 6. HCV antibody prevalence (%) by jurisdiction, 2012–2016

Figure 7. HCV antibody prevalence (%) by time since first injection, 2016

In all survey years, prevalence of HCV was also higher among respondents reporting heroin or other opioids as the last drug injected compared to respondents who last injected methamphetamine (Figure 8). HCV antibody prevalence was also consistently higher among respondents who reported imprisonment in the year preceding survey completion compared to those who had not been incarcerated ($p<0.001$ in all years 2012 to 2016) and among respondents who reported receptive syringe sharing in the last month compared to respondents who did not report receptive syringe sharing ($p<0.05$ in 2012, 2014 and 2015).

Figure 8. HCV antibody prevalence (%) by drug last injected and gender, 2012–2016

HIV and HCV testing

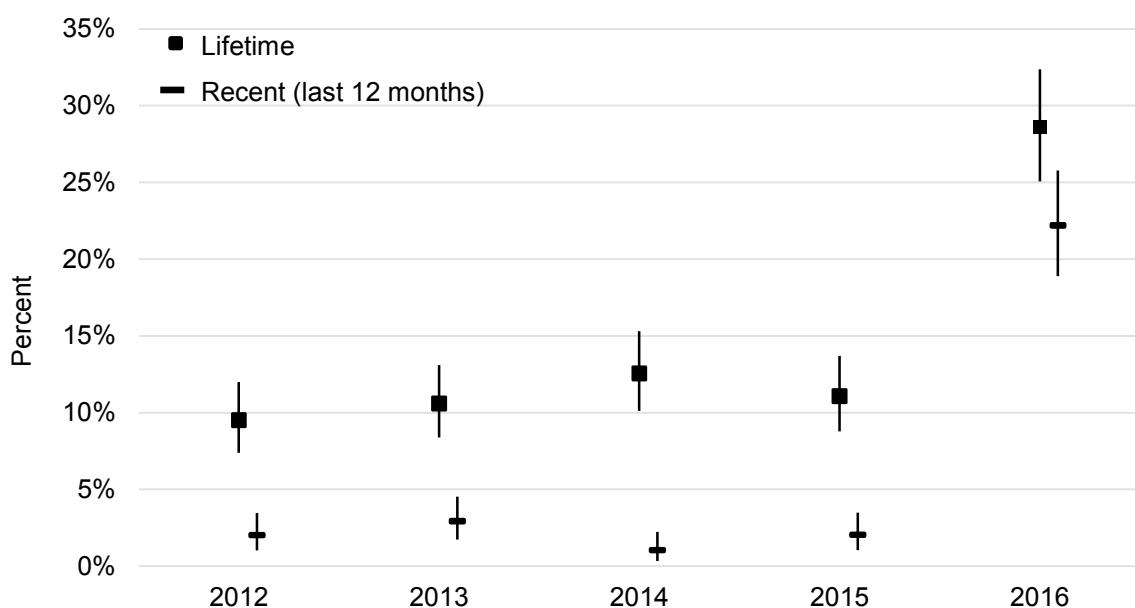

High rates of lifetime HIV diagnostic screening were reported by ANSPS respondents over the period 2012 to 2016, with 82% to 85% of respondents reporting an HIV diagnostic test (Table 1.1.5). In 2016, 51% of respondents reported an HIV diagnostic test in the previous 12 months. Among the 31 respondents who tested HIV antibody positive, the majority (81%) were aware of their HIV positive status, 6% (n=2) reported their status as HIV negative, 6% (n=2) did not know their HIV status and 6% (n=2) did not report their HIV status.

Respondents also reported high rates of lifetime HCV diagnostic screening (range 83% to 88%). In 2016, just over half (54%) of respondents reported having had a HCV test in the previous 12 months.

HCV treatment uptake

As shown in Figure 9, among respondents who tested HCV antibody positive and after excluding those who self-reported spontaneous HCV clearance, the proportion who reported a lifetime history of HCV antiviral treatment was stable between 2012 and 2015 (range 10-13%, χ^2 trend p=0.251) but increased significantly to 29% in 2016 (5-year χ^2 trend p<0.001). Similarly, among respondents who tested HCV antibody positive and after excluding those who reported spontaneous clearance or treatment-induced clearance more than 12 months previously, the proportion who reported recent (last 12 months) HCV treatment was low and stable between 2011 and 2015 (range 1-3%, χ^2 trend p=0.455) but increased significantly to 22% in 2016 (five year χ^2 trend p<0.001). An increase in the proportion of respondents who reported recent initiation of HCV treatment was observed in all jurisdictions in 2016.

Figure 9. Proportion of respondents (%) reporting lifetime and current antiviral treatment among HCV antibody positive respondents, 2012–2016

Appendix B: Methodological notes

Capillary blood was obtained by finger-prick using disposable lancets and cotton-fibre blotting paper. Dried blood samples were kept at room temperature at the survey sites and couriered to a central laboratory every second or third day. HIV antibody was detected using the Murex 1.2.0 ELISA (Diasorin). Repeatedly reactive specimens were subjected to Western blot confirmatory testing (Bio-Rad New LAV blot 1, France). A modified third generation enzyme immunoassay (Monolisa anti-HCV Plus Version 3 EIA, Biorad, France) was used to test for HCV antibody. A modified cut off value for optical density was calculated to capture greater than 95% of the seronegative population. Specimens were considered positive for HCV antibody if the optical density to cut off ratio was greater than or equal to one on initial and subsequent testing.

Data presented in this report were analysed using Stata, Version 14 (Stata Corporation, College Station TX). Changes in HIV and HCV antibody prevalence overtime were assessed using the χ^2 test for linear trend. Associations between demographic and behavioural variables and HIV and HCV antibody prevalence were assessed using the χ^2 test or Fisher's exact test where expected frequencies were less than five.

Percentage values in tables may not add to 100 due to rounding. Totals in HIV and HCV antibody prevalence tables stratified by gender include people whose gender was not reported or reported as transgender. Time since first injection was calculated by subtracting age at first injection from age at survey completion. Totals in HIV and HCV antibody prevalence tables stratified by time since first injection include people who did not report age at survey completion or age at first injection.

Tables reporting HIV antibody prevalence stratified by demographic and drug use characteristics are not included in this report for states and territories or survey years where the number of HIV antibody positive participants was less than 5 in all years. Where data were collected but no participants endorsed a particular response, results are presented as "0 (0)". The symbol "--" shown in some tables denotes missing data; and is used to identify circumstances where data were not collected in the reported format. The vast majority of survey questions were consistent over all survey years.

NSP staff recorded sex, age group and survey participation for all clients at the NSP during the survey period and this data was used to assess response rates. Some clients visited the site more than once during the survey week, and only one attendance per person was included in the response rate denominator. Ethical approvals for the study were obtained from Human Research Ethics Committees associated with the investigators and participating sites. Verbal rather than written informed consent was obtained to assure the anonymity of participants.

Appendix C: List of Tables

1. Demographic characteristics and drug use

- Table 1.1.1 Number (percentage) of respondents by demographic characteristics and survey year
- Table 1.1.2 Number (percentage) of respondents by last drug injected, frequency of injecting and survey year
- Table 1.1.3 Number (percentage) of respondents by injecting behaviour in the last month and survey year
- Table 1.1.4 Number (percentage) of respondents by treatment for drug use and survey year
- Table 1.1.5 Number (percentage) of respondents by testing for HIV and HCV, HCV treatment by survey year
- Table 1.1.6 Number (percentage) of respondents by sexual behaviour in the month prior to survey and survey year
- Table 1.1.7 Number (percentage) of respondents reporting stigma or discrimination in the last 12 months in 2016

2. HIV antibody prevalence

- Table 1.2.1 HIV antibody prevalence by gender and survey year
- Table 1.2.2 HIV antibody prevalence by sexual identity, gender and survey year
- Table 1.2.3 HIV antibody prevalence by age group, gender and survey year
- Table 1.2.4 HIV antibody prevalence by last drug injected, gender and survey year
- Table 1.2.5 HIV antibody prevalence by years of injection, gender and survey year
- Table 1.2.6 HIV antibody prevalence by re-use of someone else's used needle and syringe last month, gender and survey year
- Table 1.2.7 HIV antibody prevalence by frequency of drug injection last month, gender and survey year
- Table 1.2.8 HIV antibody prevalence by imprisonment last year, gender and survey year
- Table 1.2.9 HIV antibody prevalence by condom use at last sex with regular partner, gender and survey year
- Table 1.2.10 HIV antibody prevalence by sex work last month, gender and survey year
- Table 1.2.11 HIV antibody prevalence by Aboriginal and Torres Strait Islander origin status, gender and survey year
- Table 1.2.12 HIV antibody prevalence by main language spoken at home by parents, gender and survey year
- Table 1.2.13 HIV antibody prevalence by region/country of birth, gender and survey year

3. HCV antibody prevalence

- Table 1.3.1 HCV antibody prevalence by gender and survey year
- Table 1.3.2 HCV antibody prevalence by sexual identity, gender and survey year
- Table 1.3.3 HCV antibody prevalence by age group, gender and survey year
- Table 1.3.4 HCV antibody prevalence by years since first injection, gender and survey year
- Table 1.3.5 HCV antibody prevalence by re-use of someone else's used needle and syringe last month, years since first injection and survey year
- Table 1.3.6 HCV antibody prevalence by last drug injected, years since first injection and survey year
- Table 1.3.7 HCV antibody prevalence by frequency of drug injection last month, years since first injection and survey year
- Table 1.3.8 HCV antibody prevalence by imprisonment last year, years since first injection and survey year
- Table 1.3.9 HCV antibody prevalence by sex work last month, years since first injection and survey year
- Table 1.3.10 HCV antibody prevalence by Aboriginal and Torres Strait Islander origin status, gender and survey year
- Table 1.3.11 HCV antibody prevalence by main language spoken at home by parents, gender and survey year
- Table 1.3.12 HCV antibody prevalence by region/country of birth, gender and survey year
